Key Parameters Evaluated in Valtera Battery Tests

Valtera's testing protocols are designed to provide a holistic view of battery health and performance. For critical applications within ConocoPhillips, common parameters evaluated would include:

1. **Capacity Testing:** This measures the actual energy a battery can deliver under specific discharge conditions, comparing it against its rated capacity. A significant drop in capacity is a clear indicator of degradation.
2. **Internal Resistance Measurement:** High internal resistance can impede the flow of current, leading to reduced performance and increased heat generation. Valtera's tests precisely measure this crucial parameter.
3. **Voltage Under Load:** Evaluating battery voltage during discharge, especially under heavy loads, is essential to determine its ability to meet peak power demands.
4. **Cycle Life Testing:** For rechargeable batteries, Valtera would assess how many charge-discharge cycles a battery can endure before its capacity significantly degrades. This is critical for batteries in regularly operated systems.
5. **Temperature Effects:** Extreme temperatures, common in many oil and gas operating environments, can severely impact battery performance and lifespan. Valtera's tests often simulate these conditions.
6. **Self-Discharge Rate:** This measures how quickly a battery loses its charge when not in use. A high self-discharge rate can be problematic for backup power systems that need to remain charged for extended periods.
7. **Safety Testing:** Depending on the battery chemistry and application, Valtera may also conduct safety tests to ensure the battery behaves predictably under fault conditions.

The data generated from these tests allows ConocoPhillips to make informed decisions regarding battery replacement cycles, maintenance schedules, and the selection of batteries best suited for specific operational challenges.
